present invention describes polynucleotide sequences (I) which encode
                                                                                                                                                                                           prostate-specific proteins (II). (I) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I), (II), and can be used in vaccine production and gene therapy. (I), (II), (II), fusion proteins comparising (II), and isolated (II), and isolated (II) are used treat cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. The cancer that is diagnosed or treated is particularly prostate cancer. (I) and (II) can be used for monitoring the progression of cancer in a patient. (I) and (II) can also be used to improve diagnostic and therapeutic methods for prostate cancer. They can indicate the level of metastesis as well as the prostate volume. Ad#93357 to Ad#93944 and AAM0115 to AAM01318 represent polynucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1005 CCCCCTCCTGTGCCATCATGATCAGCACCTATGAGTTCGGCAAAAGCTTCTTCCAGAGGC 1064

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ó
                                                                                                                                                                                                                                                                                           polynuclectides, polypeptides, fusion proceins of the polypeptides, antibodies rated against the polypeptides (or antigenic epitopes derived from them) and antigen-presenting calls expressing the polypeptides for antigenic epitopes polypeptides. The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polynucleotides and the antigen-presenting calls are useful for stimulating and/or expanding T calls specific for a tumour protein, and for inhibiting the development of cancer especially prostate cancer. Compositions composition the polynucleotide and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The oligonucleotide is useful for
                                                                                        New human prostate-specific polypeptides and polynucleotides useful for the diagnosis and treatment of cancer, especially prostate cancer -

The present invention describes an isolated polypeptide (P1) comprising at least an immunogenic portion of a prostate-specific protein, or its variant. Also described are polymolectides (N1) encoding (P1). (P1) and (N1) have cytostatic activity and can be used in vaccine production. The polypeptides, nucleic acids and antibodies from the present invention are useful in the diagnosis and therapy of prostate cancer. Prostate specific genes P704p, P12p, P74pp, P75p and B305D are located in a genomic region on chromosome 22q11.2 known as the Cat Eye Syndrome chromosome 1. AAH84671 to AAH85143 and AAG39000 to AAG39077 represent polymolectide and polypeptide sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                        Claim 31; Page 259; 325pp; English

Prostate specific protein and its encoding polynucleotide, useful for the treatment and diagnosis of prostate cancer -Claim 50; Page 244; 276pp; English. The present invention describes an isolated polypeptide (1) comprising at least an immunogenic portion of a prostate tumour antigen protein or its variant. (1) have cytostatic activity and can be used in vaccine

ö production. (I), prostate tumour antigen polynucleotides, an antigen presenting call (AFC e.g. a dendritic cell) that expresses (I), and a pharmaceutical composition containing (I) are useful for inhibiting the development of cancer in a patient. Antibodies specific for prostate specific proteins and oligonucleotides that hybridise to a polynucleotide that encodes a prostate specific protein are useful for detecting the presence or absence of a cancer or monitoring the progression the progression of a cancer, especially prostate cancer. ANHOWAL2 to ANHORAYS to ANHOWAND and ANHOWAND are sequences used in the exemplification of the present invention. 1005 CCCCCTCCTGTGCCATCATGATCAGCACCTATGAGTTCGGCAAAAGCTTCTTCCAGAGGC 1064 61 coccrecrererearcarcaccaccrargacricegeaaaaccrrcracaaagc 120 Gaps 0 15.3%; Score 170; DB 22; Length 537; 100.0%; Pred. APPLICANT: Penn, Sharion G.
APPLICANT: Hanzel, David K.
APPLICANT: Hanzel, David K.
APPLICANT: Chen, Wensheng

APPLICANT: Chen, Wensheng

TITLE OF INVENTION: HUMAN GENOME-DERIVED SINGLE EXON NUCLEIC ACID PROBES USEFUL FOR TITLE OF INVENTION: GENE EXPRESSION ANALYSIS BY MICROARRAY
FILE REFERENCE: Acomica-X-1
CURRENT PAPLICATION NUMBER: US/09/9864,761

CURRENT FILING DATE: 2001-05-23

PRIOR APPLICATION NUMBER: US 60/180,312

PRIOR FILING DATE: 2000-02-04
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0
